

Introduction to the DPE ZED Shield and its context

The design of the DPE ZED Shield was born from the urgent need to find a solution to a runaway chain reaction triggered by geoengineering. Until less than a year ago geoengineering, with the use of microwaves and chemtrails, was able to create apparently natural catastrophic phenomena in localized areas. This information has now become public knowledge. Nature has tried to maintain its balance and harmony but there is now an excess of microwave energy and large quantities of metals suspended in the atmosphere, which have caused the breaking load level to be exceeded. All of this is resulting in sudden and very often simultaneous environmental catastrophes and multiple earthquakes across the world.

Premise

Until recently, solar energy, which is composed of electromagnetic waves whose wavelength is between 230 and 4000 nm, with a maximum emission around 500 nm, reached the Earth, which absorbed these energies and re-emitted them, feeding the Earth's magnetosphere in response, which in turn created a defense shield proportionate to the solar radiation. A quantum of this electromagnetic energy is called a photon.

But this is not the only source of energy that reaches the Earth. There are also cosmic rays. Basically, cosmic radiation is made up of so-called primary radiation, composed of hydrogen (H 94%) and helium (He 5.5%) nuclei with great energy (up to 1021 eV per particle). To give you an idea, it is the energy of a tennis ball traveling at 100 km/h, but concentrated in a single atomic nucleus. Historically, only a small amount of this radiation "reached us" because it was slowed down by the magnetosphere and by interactions with the components of the atmosphere, the latter interaction giving rise to particles of lower energy, which constitute secondary cosmic radiation. Cosmic rays are particles of protons and electrons that move at speeds close to that of light. There is also a direct source of microwaves that reaches the Earth, this being cosmic background radiation.

The current situation

The weakening of the magnetosphere has allowed all these energies to reach the Earth in massive amounts, and when they reach the height of the stratosphere, they find a chaotic energy layer made up of all electromagnetic waves (radio transmissions, cell phones, radars, satellites, etc.)

This chaotic layer partly begins to convert energy in a process similar to that which occurs in the creation of secondary cosmic rays, and the transformation of photons into protons occurs due to the friction of the magneto-gravitational fields.

These new protons, added to cosmic ray protons and electromagnetic waves, create a true ocean of electrostatic energy in the high conductivity stratosphere, due to the heavy metals released with chemtrails.

Now, imagine this enormous mass of energy "suspended" in the stratosphere. It tries to find an outlet and when it finds the right conditions, a release occurs and large quantities of this energy descend in a narrow area. It is a bit like when

lightning discharges its energy on a tree. Depending on the conditions we therefore have floods, hurricanes, tornadoes, earthquakes and volcanic eruptions of unprecedented power which, unfortunately, will continue to increase in the number of events and their power.

Advanced Technology 7 has well understood the situation and has identified and developed a solution that, constantly and in a controlled manner, helps to discharge this energy from the stratosphere.

We chose not to force nature with the intervention of electronic or other types of equipment, which in any case would have caused a force for which we would later pay the price. We have therefore focused on the alteration of metals using various technologies to obtain the best possible result.

We use nanotechnology in combination with other new materials to make metals superconducting and with this **we have accelerated the rate of energy drainage and radioactive decay by 16,056 times, compared to the previous DPE Shield.** From our tests, the DPE Shield takes 4 hours and 46 minutes to break down chemtrails while the DPE ZED Shield manages to do the same operation in one second.

This ability to suck in so much energy creates a preferential channel through which nature manages to rebalance itself by discharging excess energy into the stratosphere, which for it is an absolute priority compared with the alternatives. This creates an exhaust radius 25 times larger than the DPE Shield. In fact, whilst the DPE Shield covers a radius of 100 km, the DPE ZED Shield covers a radius of 2500 km, due to the double torus that is formed. This covers an area of 19,625,000 square km.

When this energy is sucked up and returned to the Earth, there is a double positive action, since the amount of energy over that area is drastically reduced and in the meantime the Earth, through the DPE ZED Shield, responds by reinforcing the magnetosphere again over that area and therefore increasing the defense shield from solar and cosmic energies.

This drastically reduces the likelihood of environmental catastrophes. There may remain some narrow points where there is such congestion of waves that it cannot be significantly reduced by the DPE ZED Shield, because it is constantly saturated by emissions of large quantities but, in any case, there will be a reduction in the power of any adverse event.

In the new, revolutionary design, we respected the laws of V. Schauberger, Fibonacci, the concept of implosion and others, including even the calculation of the influence of the trajectories of the planets of the solar system and its motion around the galaxy, which all have an influence on the Earth's magnetogravitational fields.

Unlike all previous models, the DPE ZED Shield is the only one designed to work with 3 different types of energies:

Photons (Electromagnetic Waves)

Plasma (Ether)

Phonons (Vibrations)

Through a study on the interpretation of a very ancient technology before the universal flood, we understood its importance and used the energy captured by

electromagnetic waves and ether to power an apparatus that creates the vibration of life, as described in the first book of Enoch:

“Not even to the Angels did I reveal this great secret of mine, nor did I inform them of their origin because they would not have understood my infinite creation that I, today, reveal to you.

Well, before everything visible existed, I alone existed among all invisible things and moved back and forth like an infinite pulsating wave that follows the path of the sun from East to West and then from West to East. While the sun has its rest I act tirelessly because I have to create all the things designed by Me and I have always planned to build the foundation stones and make my creation visible...”

Continuing the reading, Enoch talks about a bright red building that he calls Adoil, Diedu, Daduel, which the Egyptians called ZED...

We have tried to reproduce the same effects of an ancient but advanced technology through the most advanced modern technologies.

The DPE ZED Shield is a structure with a base 2.50m long and a diameter of 50 cm. An additional 2-meter antenna is screwed onto it, giving a total length of 4.50m.

Prototype DPE ZED Shield alongside a DPE100

Our mission is to help the planet and human beings who have primary emergencies, so although the DPE ZED Shield is much more expensive to make than the original DPE Shield, we will keep the same price in order to facilitate as much as possible those people who really want to do something useful to save the planet, including the human race and themselves.

We must absolutely prevent the Earth from reaching the critical point where it is no longer being able to receive sufficient energy to power the magnetosphere, causing this to collapse, leaving the entire planet exposed to radiation without any possibility of reducing its strength, which will lead to widespread cancer, extinction of most of plant world and much more. No electrical equipment would work anymore for many years, as it works on the concept of double polarity, the negative phase (the Earth) and the positive phase (the Sun). With the fall of the magnetosphere, the solar energy would hit the Earth with sufficient power to have only one phase (the positive phase), therefore no double polarity. It is very similar to what happens, but for a short time, when a solar flare hits the Earth and causes a blackout over large territories. Imagine that this lasts for years and years.

The DPE ZED Shield includes life affirming technology from ancient Egypt to deliver the Agricultural benefits provided by the DPE Agriculture and the DPE Shield Agriculture, using this new/old technology and approach.

Question: How big will be the agricultural zone from the DPE ZED Shield?

Giovanni's reply:

"I have no information on this, especially because of the current state of the magnetosphere. But I'm sure of this ... all crop fields without a DPE will have the following problems:

To achieve the same harvest, they will have to triple all the products (fertilizers, fungicides etc..) and given the work the plants are doing, they will need much more water. Demonstrating this is simple. In the past, when the magnetosphere was stronger and healthier and electromagnetic pollution was less, the plants grew much more easily and were larger with less water. There was also much less damage from bad weather. If you ask an old farmer, he will confirm this.

We know that plants grow at night because this process is due to the rising energy from the magnetosphere, but as this force has decreased, plants are starting to grow less and much more slowly. Furthermore, electrostatic energy and pressure and solar radiation during the day significantly weakens their immune system, they will be more dehydrated and will become unhealthy. There has always been talk of the progressive weakening of the magnetosphere but we are the first to know the reason and above all to offer a solution. I think this concept is very important to communicate. If the earth's magnetosphere were to collapse, it will create a chain reaction on all the other planets as they will have to find another balance in the magnetic and gravitational universe."

This means deploying the DPE ZED Shield across the planet has become a critical issue.

We have made and are making our maximum effort because we are aware of the seriousness of the problem, but we cannot do anything more without your support and while we still have time...
